

KOI CARE
Antifoam

foam eliminator

Unightly foam and froth present on the surface of ponds is due to an excess of protein in the water. The more protein present the larger the amount of foam.

The actions of Antifoam will breakdown the froth, but it will not get rid of the protein in the water. Antifoam is non toxic and can be used daily if necessary.

If there is a lot of foam constantly present, the efficiency of the biological filtration system should be checked using Pondlab Ammonia and Nitrite test kits, and the amount of food fed should be reduced. Also add Actizyme pellets to boost the activity of the filter system, and perform a partial water change.

See also **Protein Skimmer** for a long term solution to foaming.

Dosage:

As a guide, add 2.5 ml of Antifoam per 1000 gallons of pond water.

It may be necessary to increase this dose or repeat it more than once.

Pack size	Treats		
	Litres	Imp. Gallons	US Gallons
125 ml	222 800	50 000	60 000
250 ml	445 600	100 000	120 000
